PLATE CLEANER

Plate cleaner and reactivator

It is an effective plate cleaner and reactivator suitable to all offset aluminium printing plates, including CTP. Its cleaning characteristics assure the adequate removal of ink residues on the plates' surface. Plate Cleaner is valid for use on plates printing with conventional inks.

Properties

- It is an acid emulsion, mixture of hydrocarbons mainly aliphatic with a moderate proportion of aromatics.
- Exempt of chlorinated solvents.
- It has a slow evaporation rate and a high flash point ($>62^{\circ}\text{C}$).
- Plate Cleaner is water miscible, which allows for a fast and complete removal of its own residues, from the plates' surface.
- It makes it easier the cleaning-up of both ink and paper dust residues.
- Not only it eliminates oxidation, but also reactivates the plate.
- Valid for all mostly known plates in the market.
- It has a specially mild abrasive characteristic and, at the same time, a strong cleaning effect.
- It does not provoke damages in the printing machine.
- Economical to use due to its proven efficiency.

How to use

Shake well the Plate Cleaner before use. Apply it, as it is, over the plates' surface using a suitable piece of cloth, sponge, or similar. Finally rinse it off with water.

Observation: Being an emulsion it can present a separation, in different phases, after prolonged storage. This effect does not represent a loss in the products' quality. With a vigorous shaking, it will recuperate its normal users' status.
